

Existing embedding; all cells; high values plotted last. Gray = zero/low; each gene has own color cap.
 No new clustering or statistical tests. $\log_{1p}(\text{counts per } 10k)$, clipped at positive-value 99th percentile.

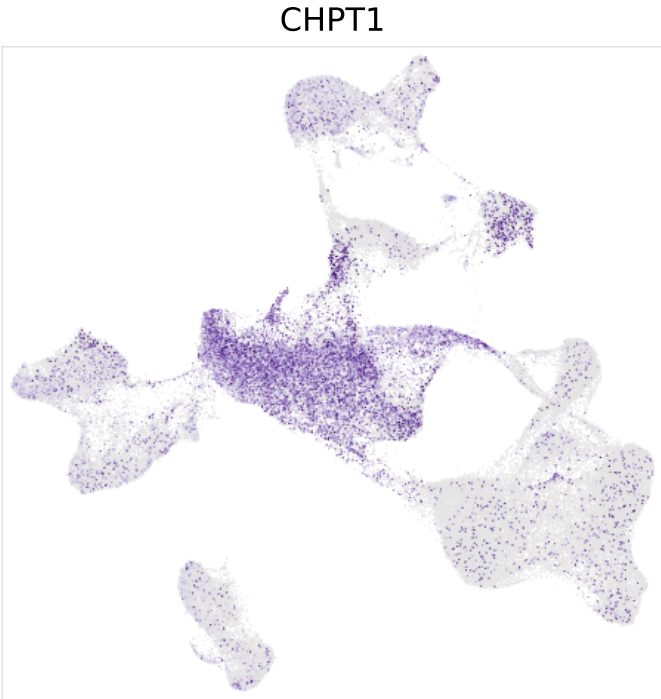

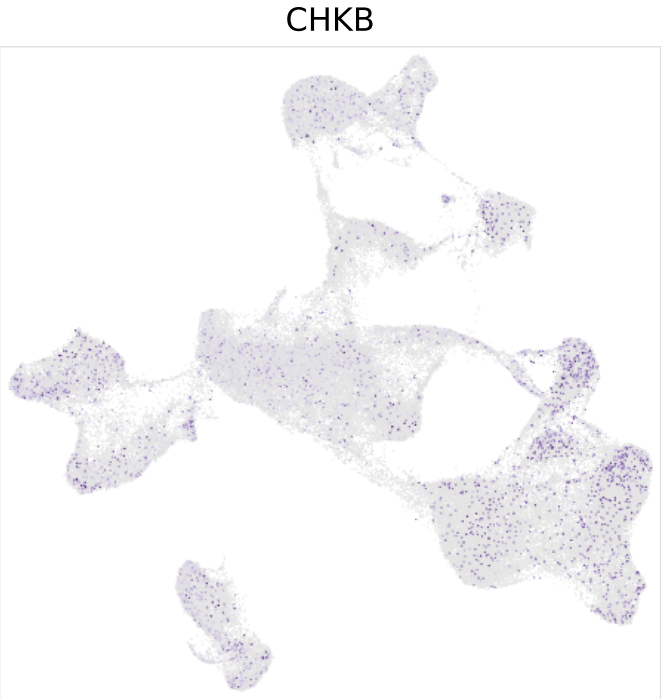

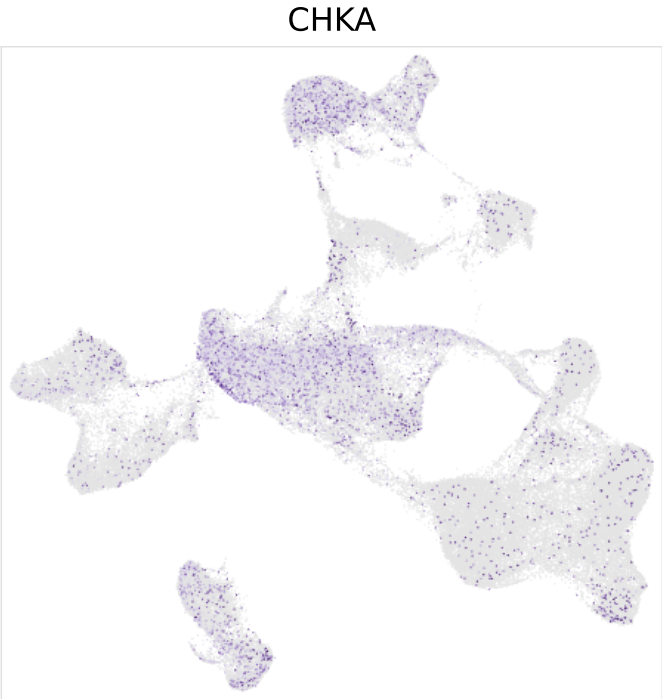

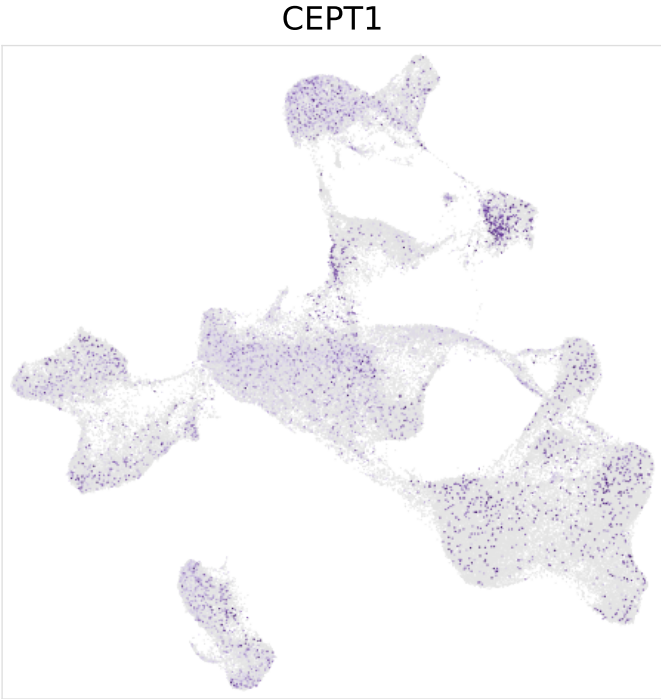

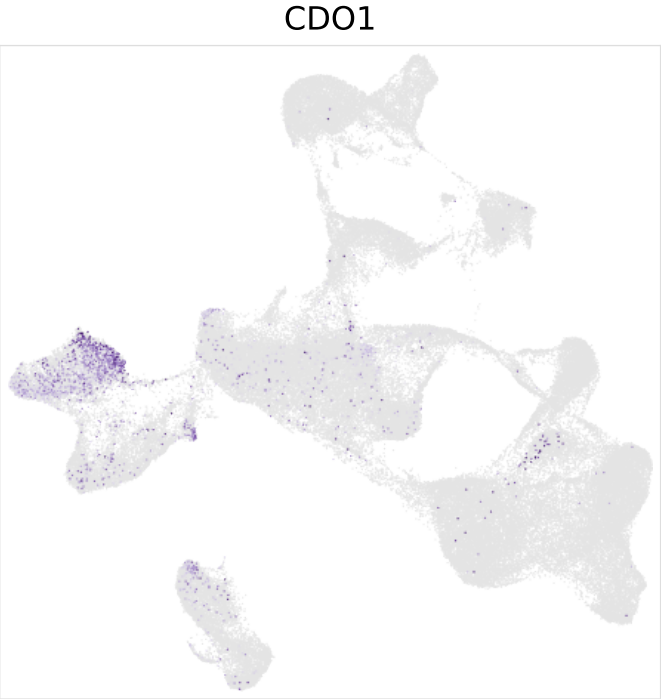

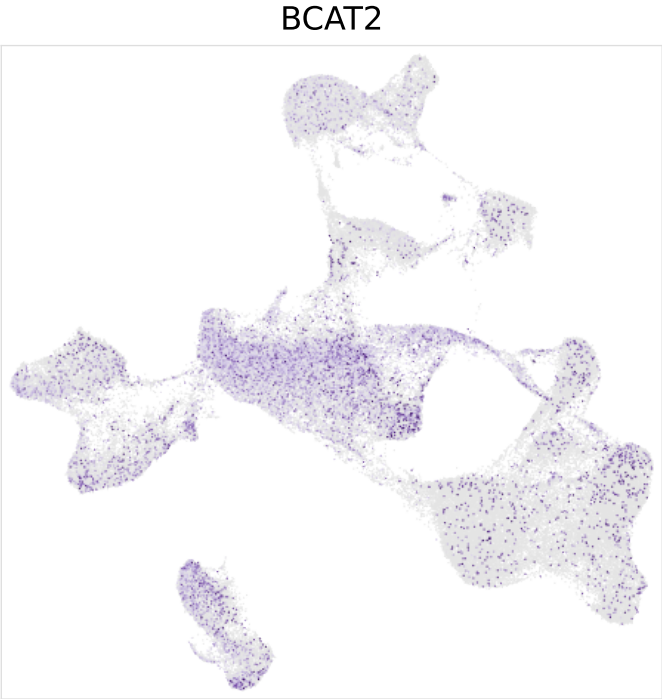

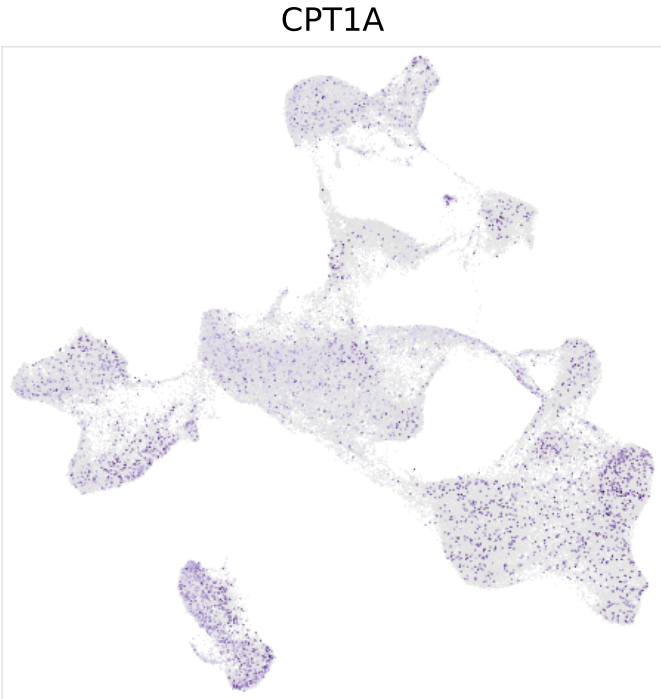

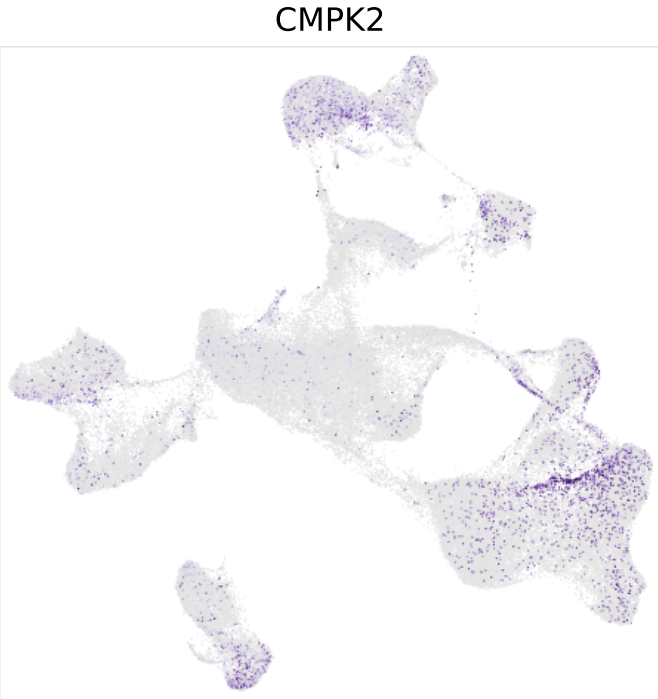

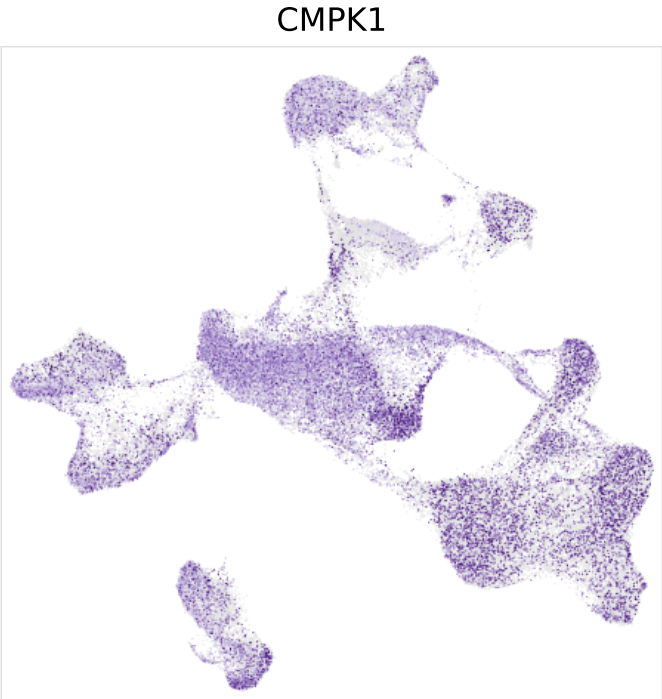

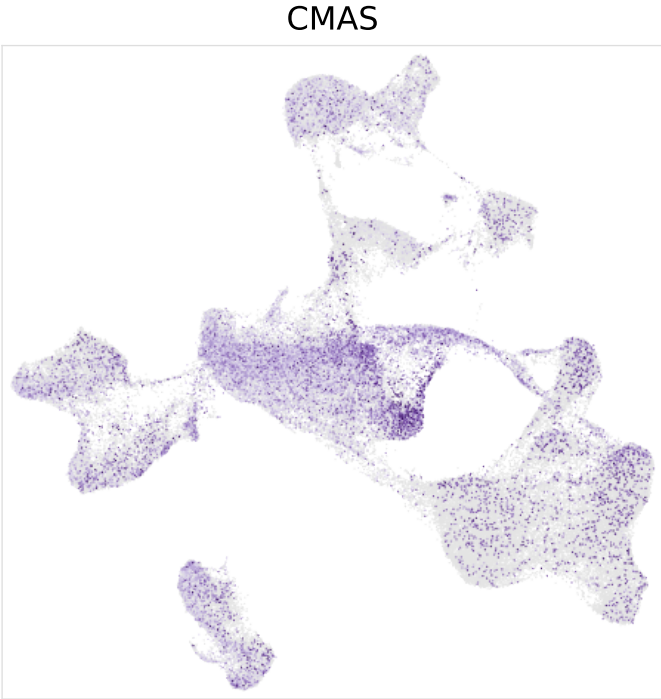

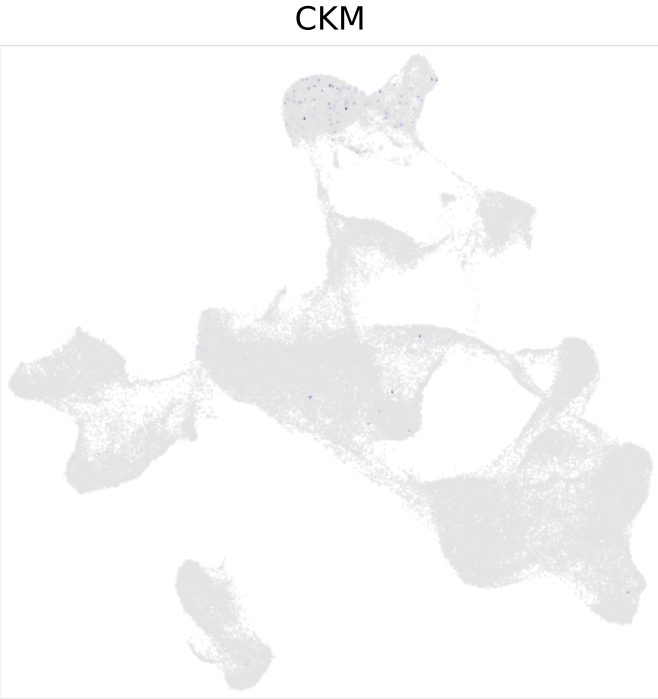

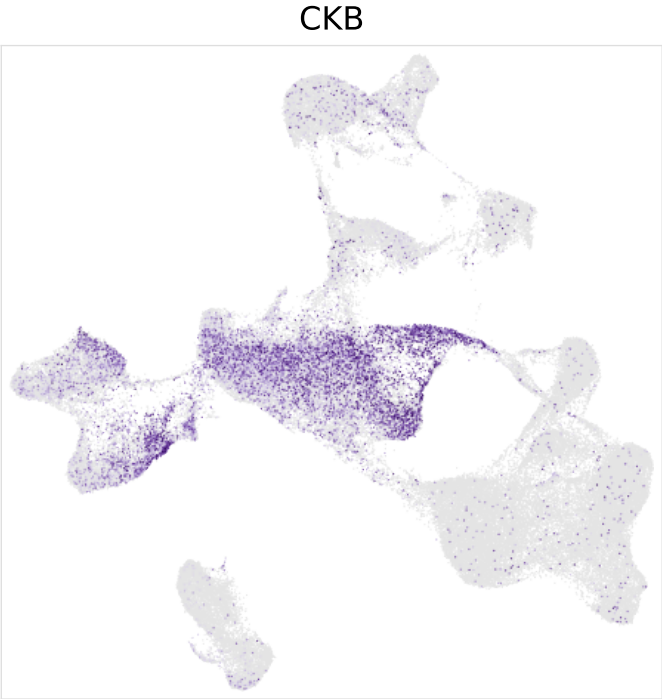

Existing embedding; all cells; high values plotted last. Gray = zero/low; each gene has own color cap.
No new clustering or statistical tests. $\log_{10}(\text{counts per } 10^4)$, clipped at positive-value 99th percentile.

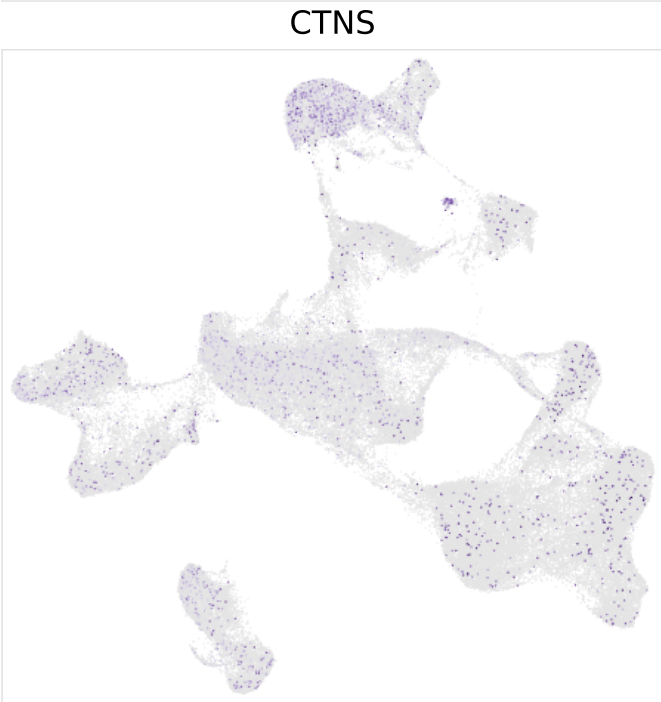

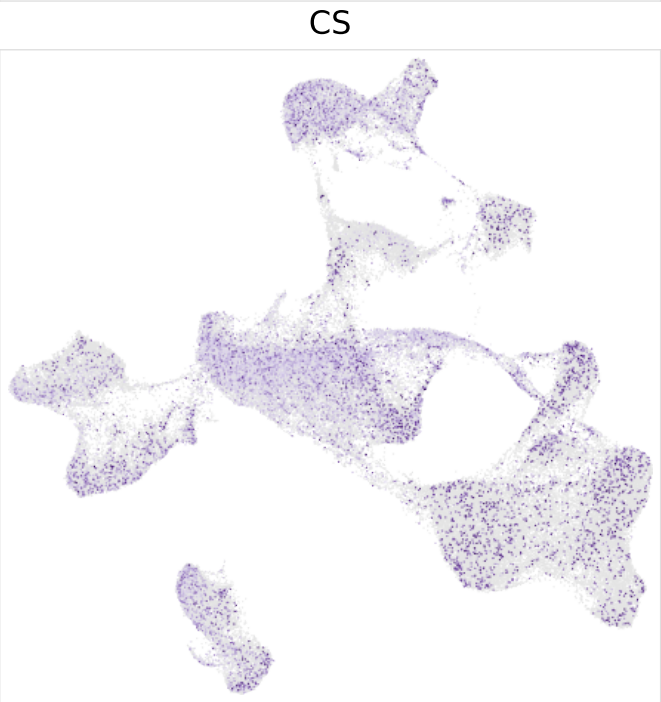

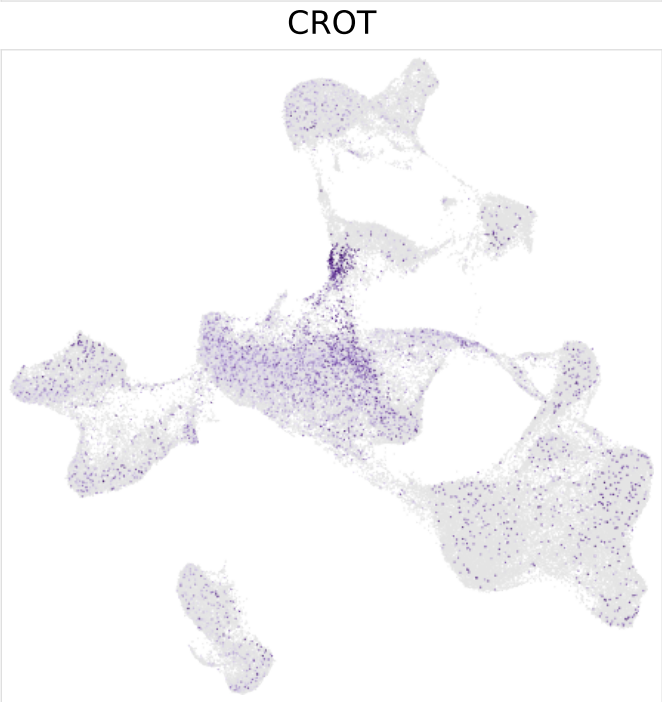

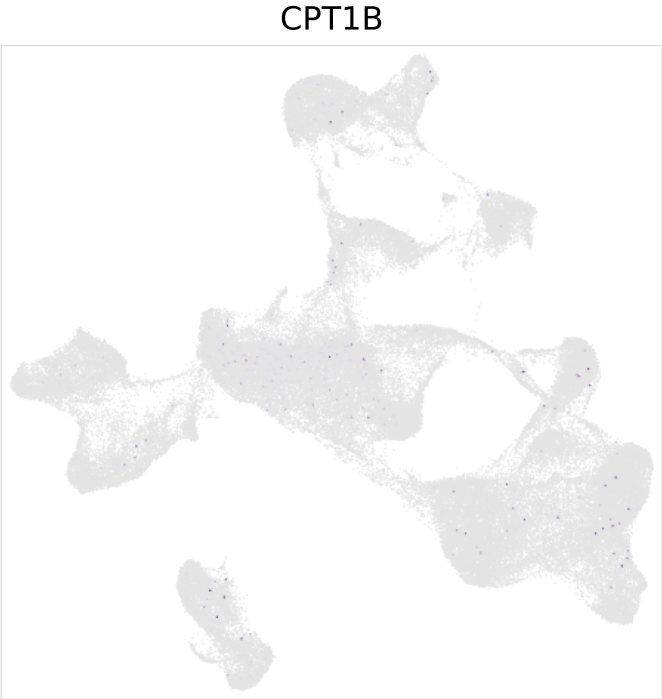

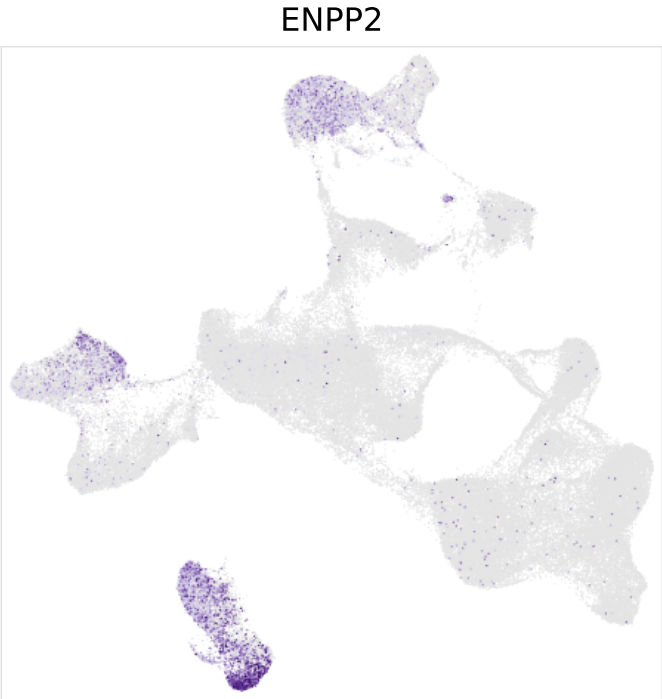

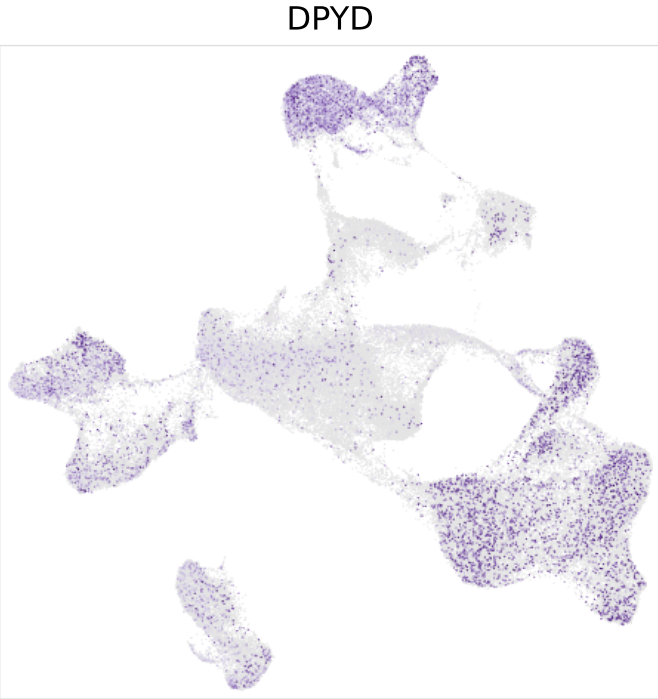

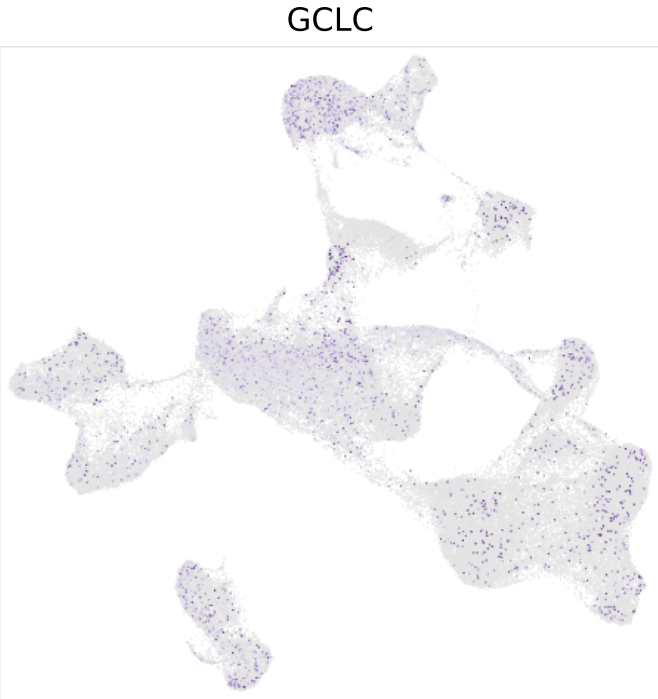

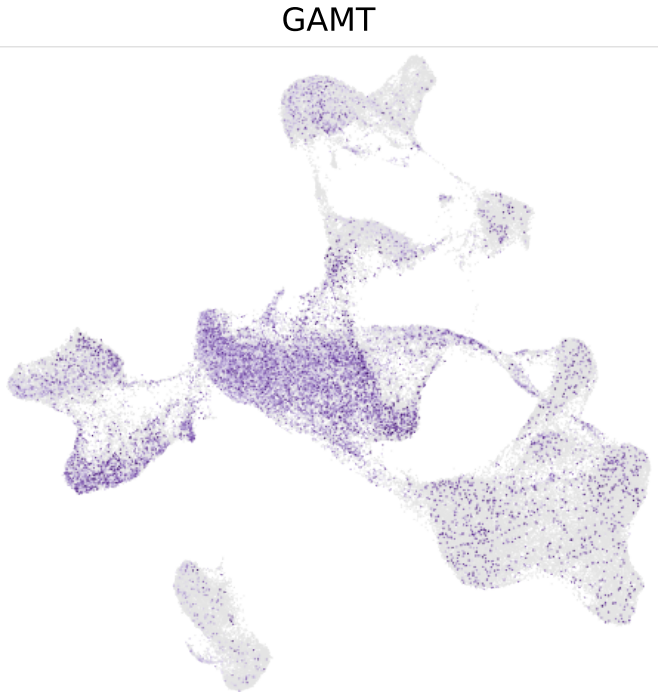

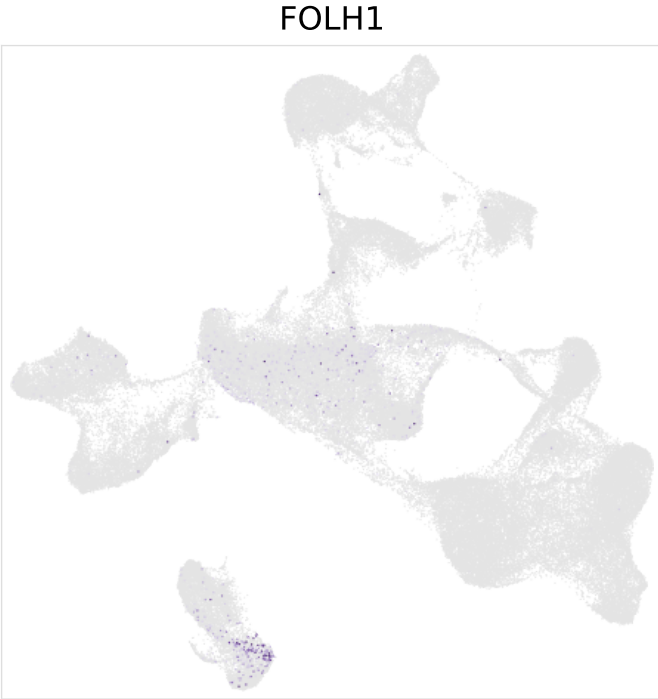

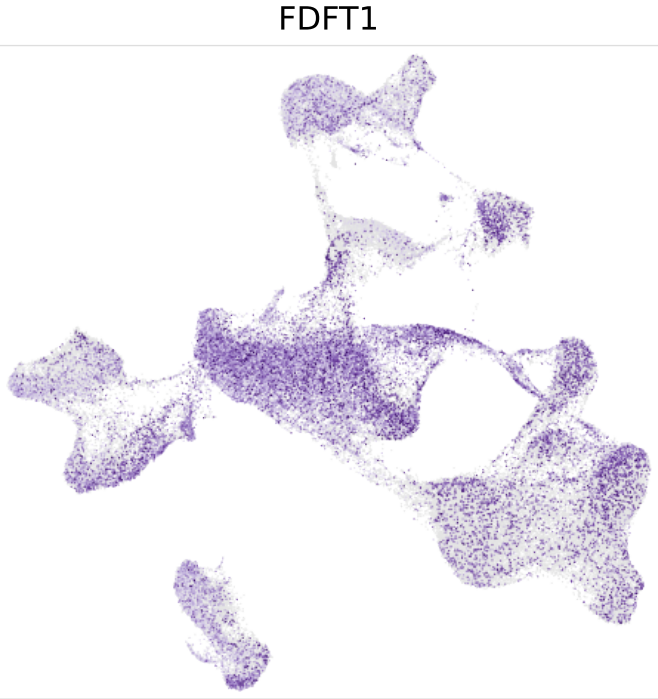

Existing embedding; all cells; high values plotted last. Gray = zero/low; each gene has own color cap.
No new clustering or statistical tests. $\log_{10}(\text{counts per } 10^4)$, clipped at positive-value 99th percentile.

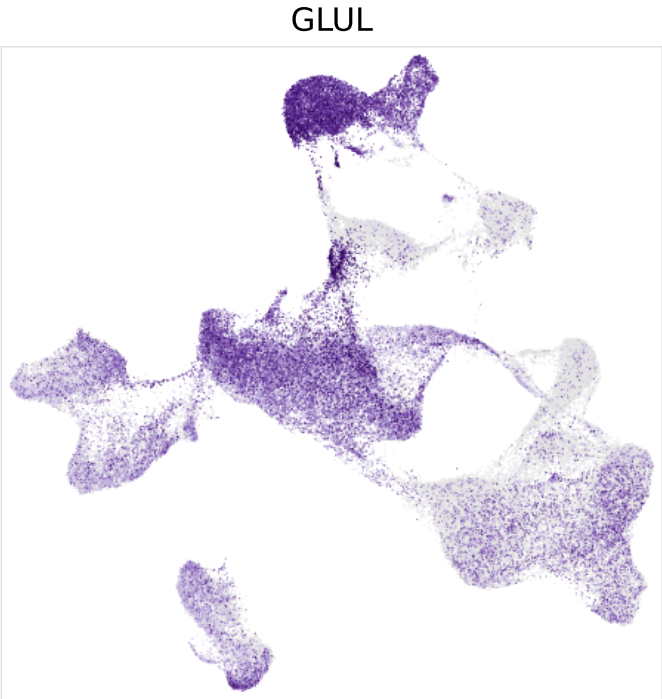

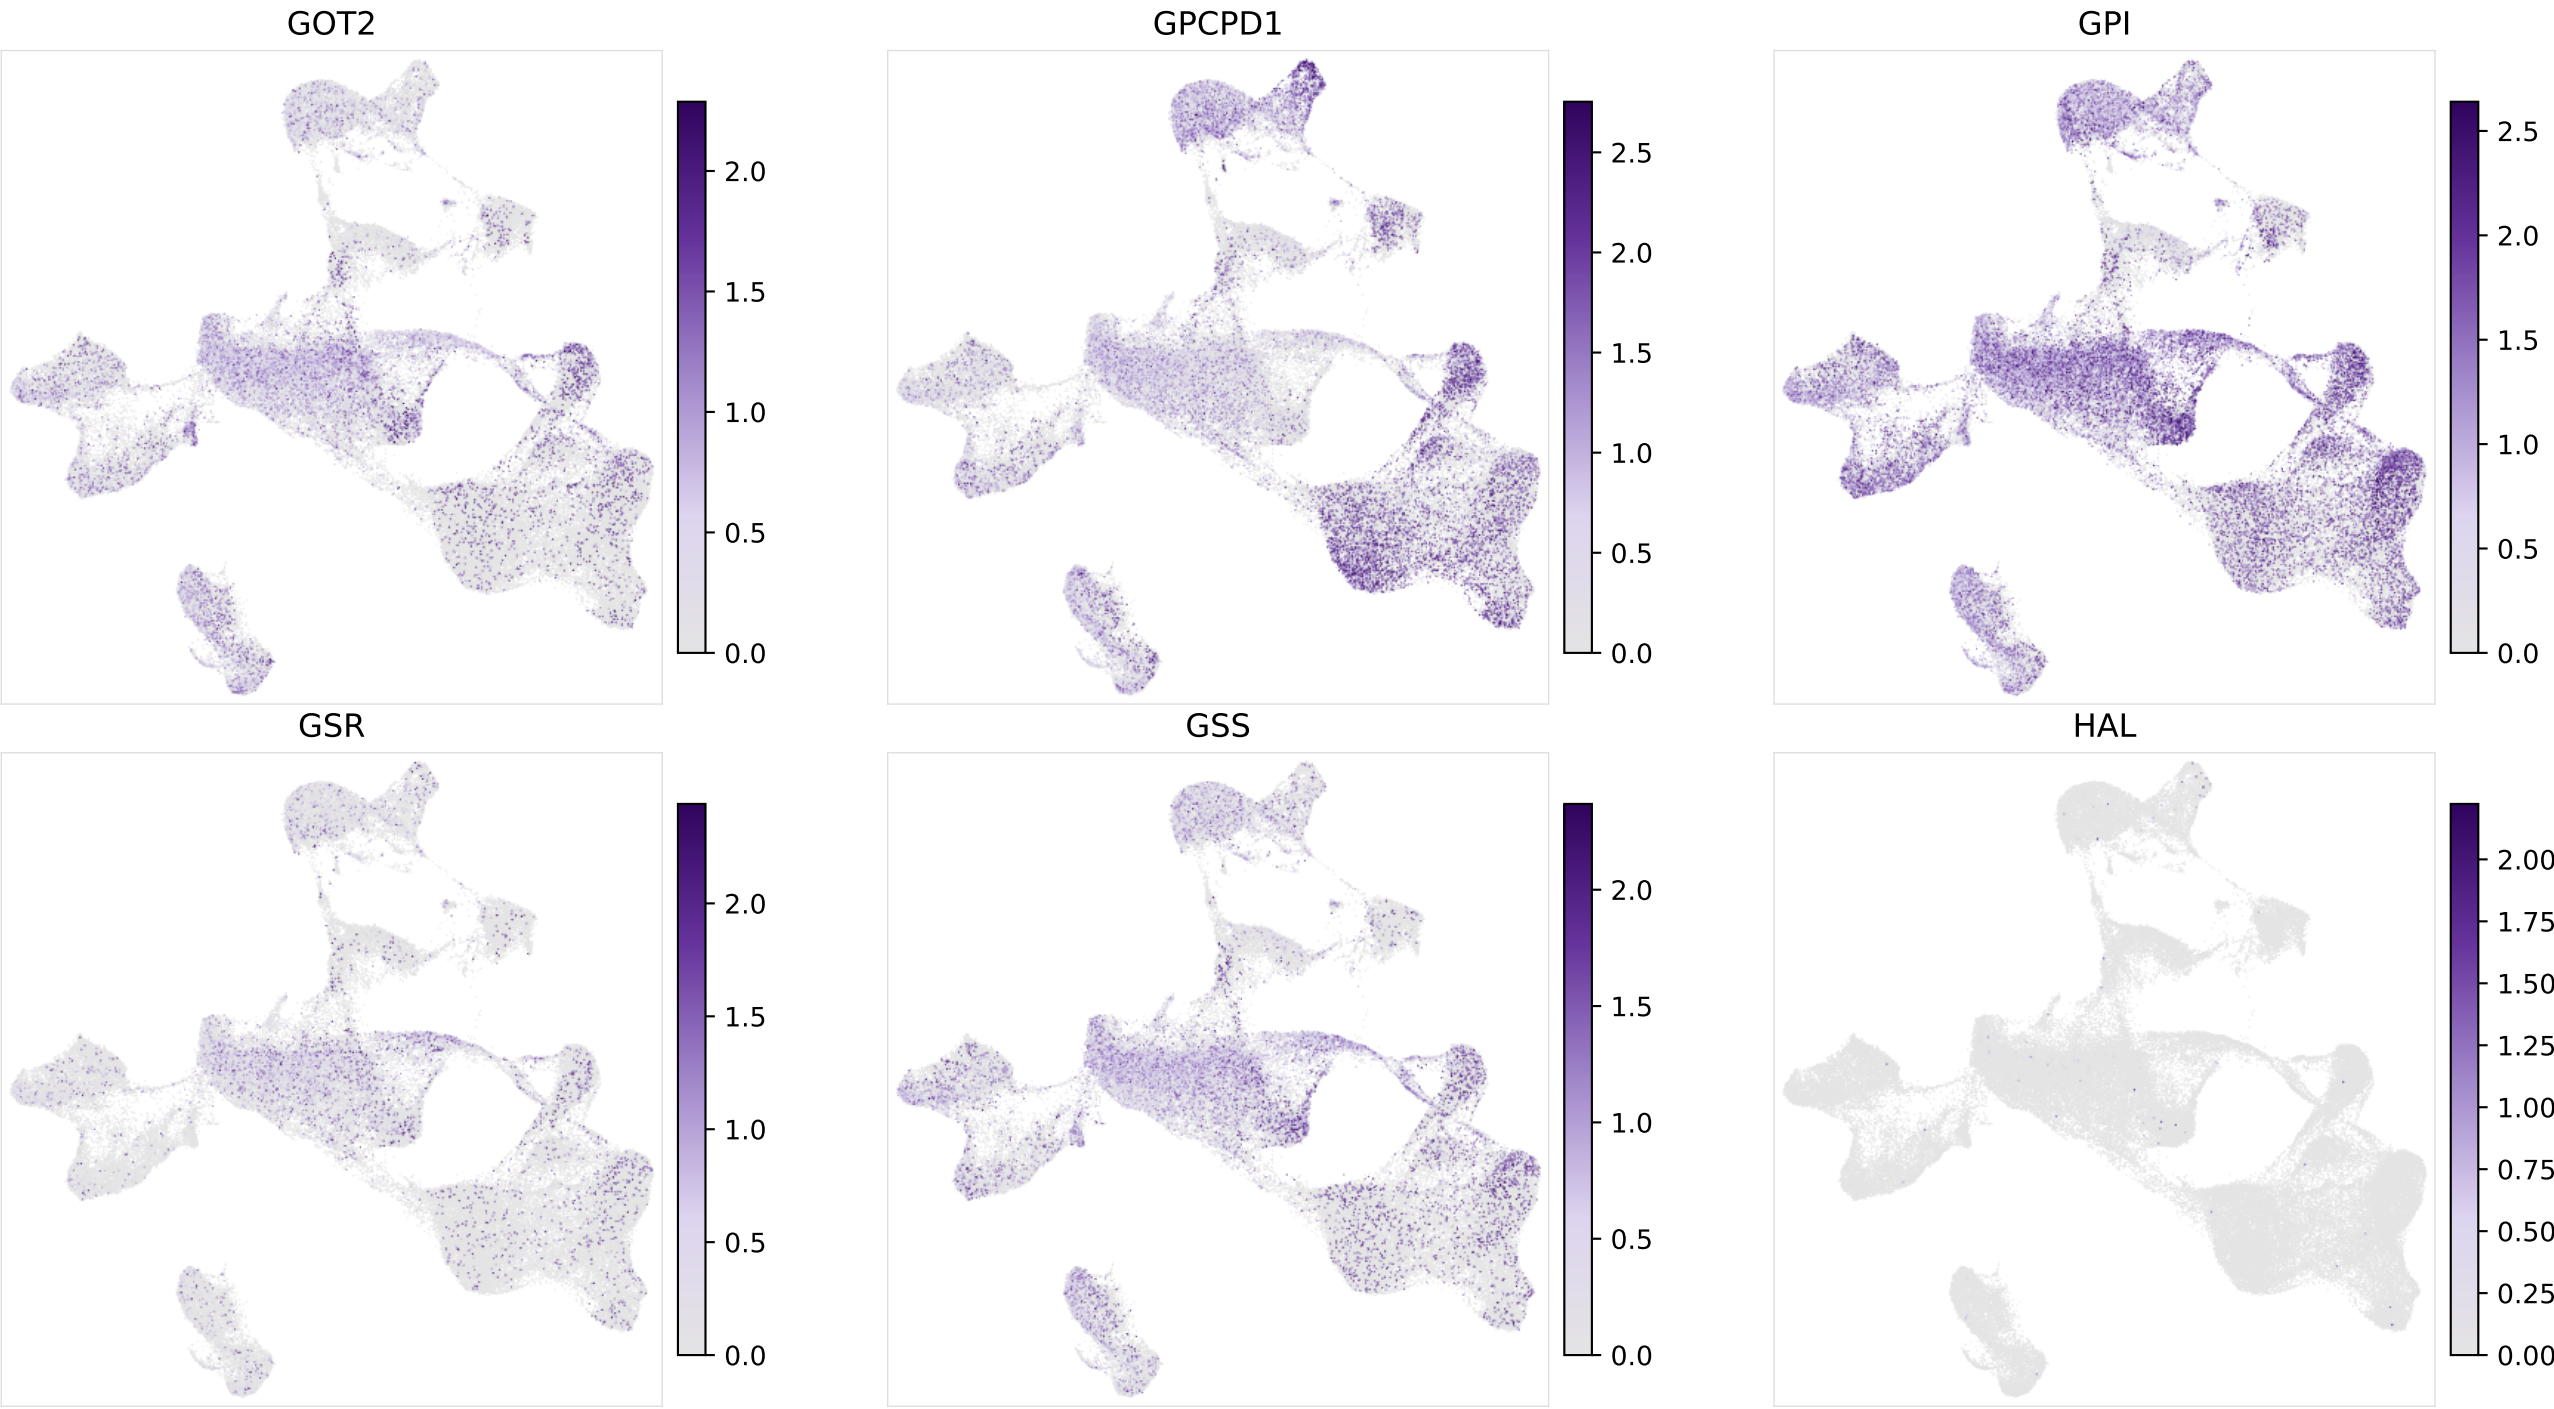

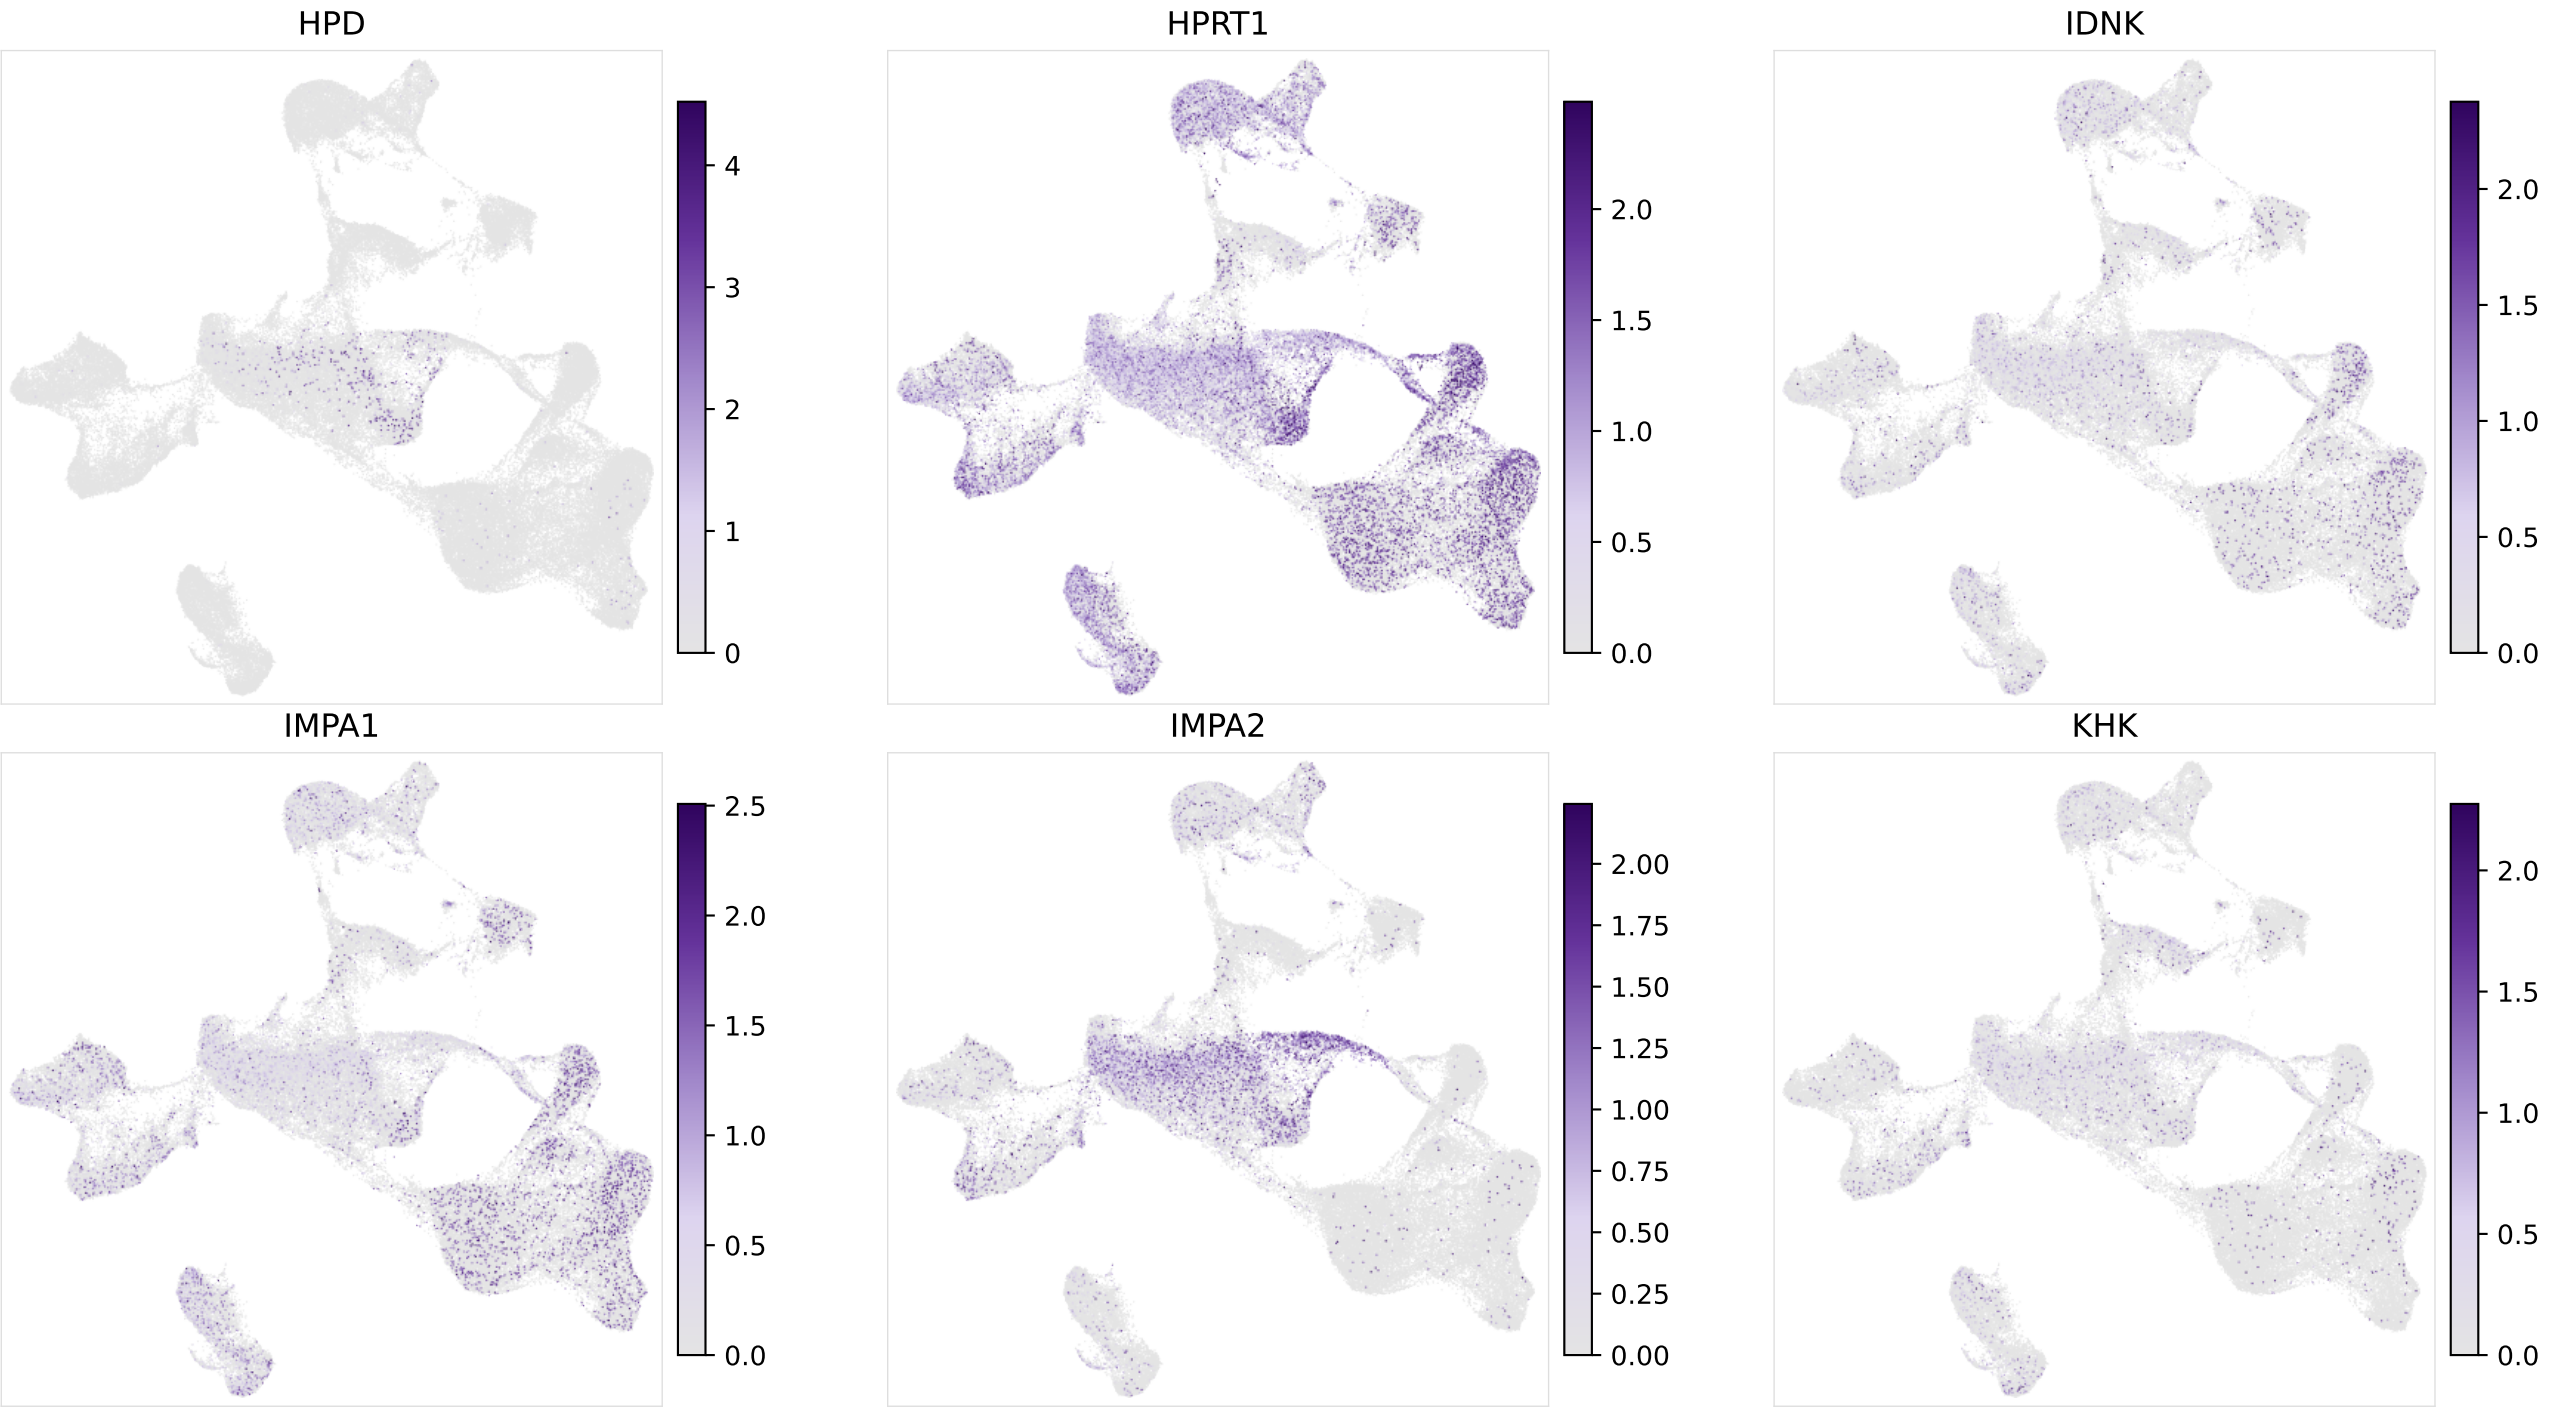

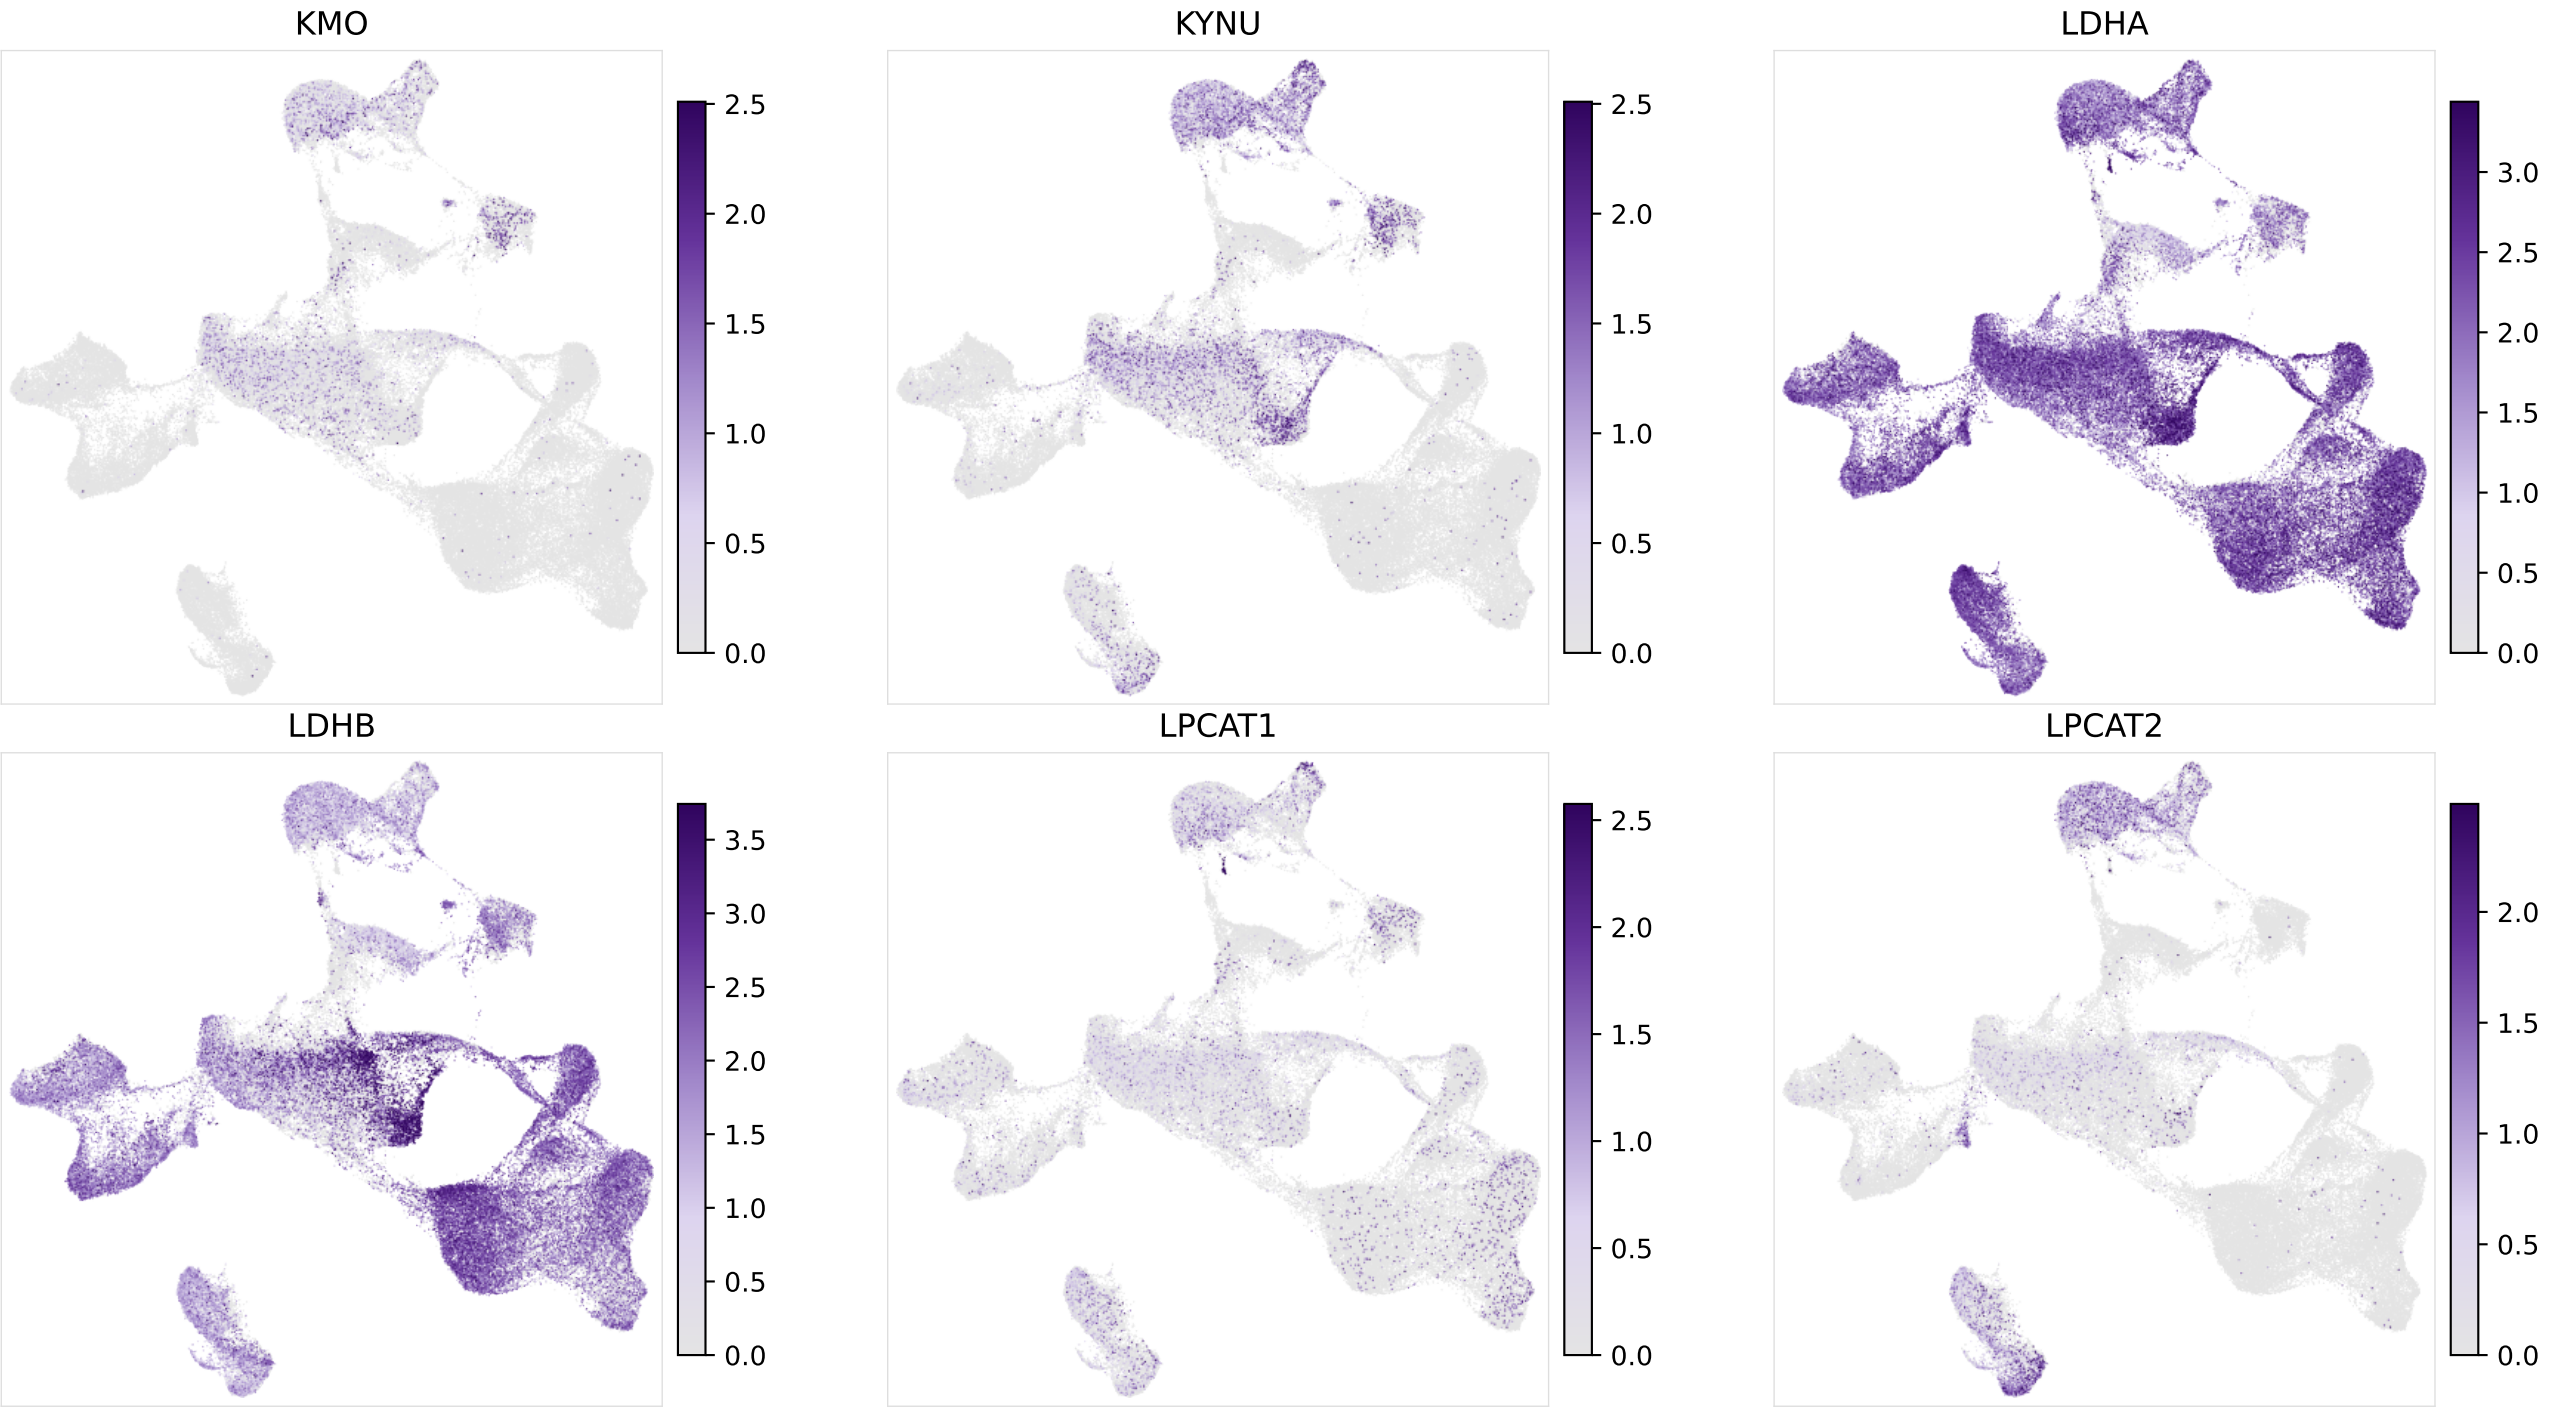

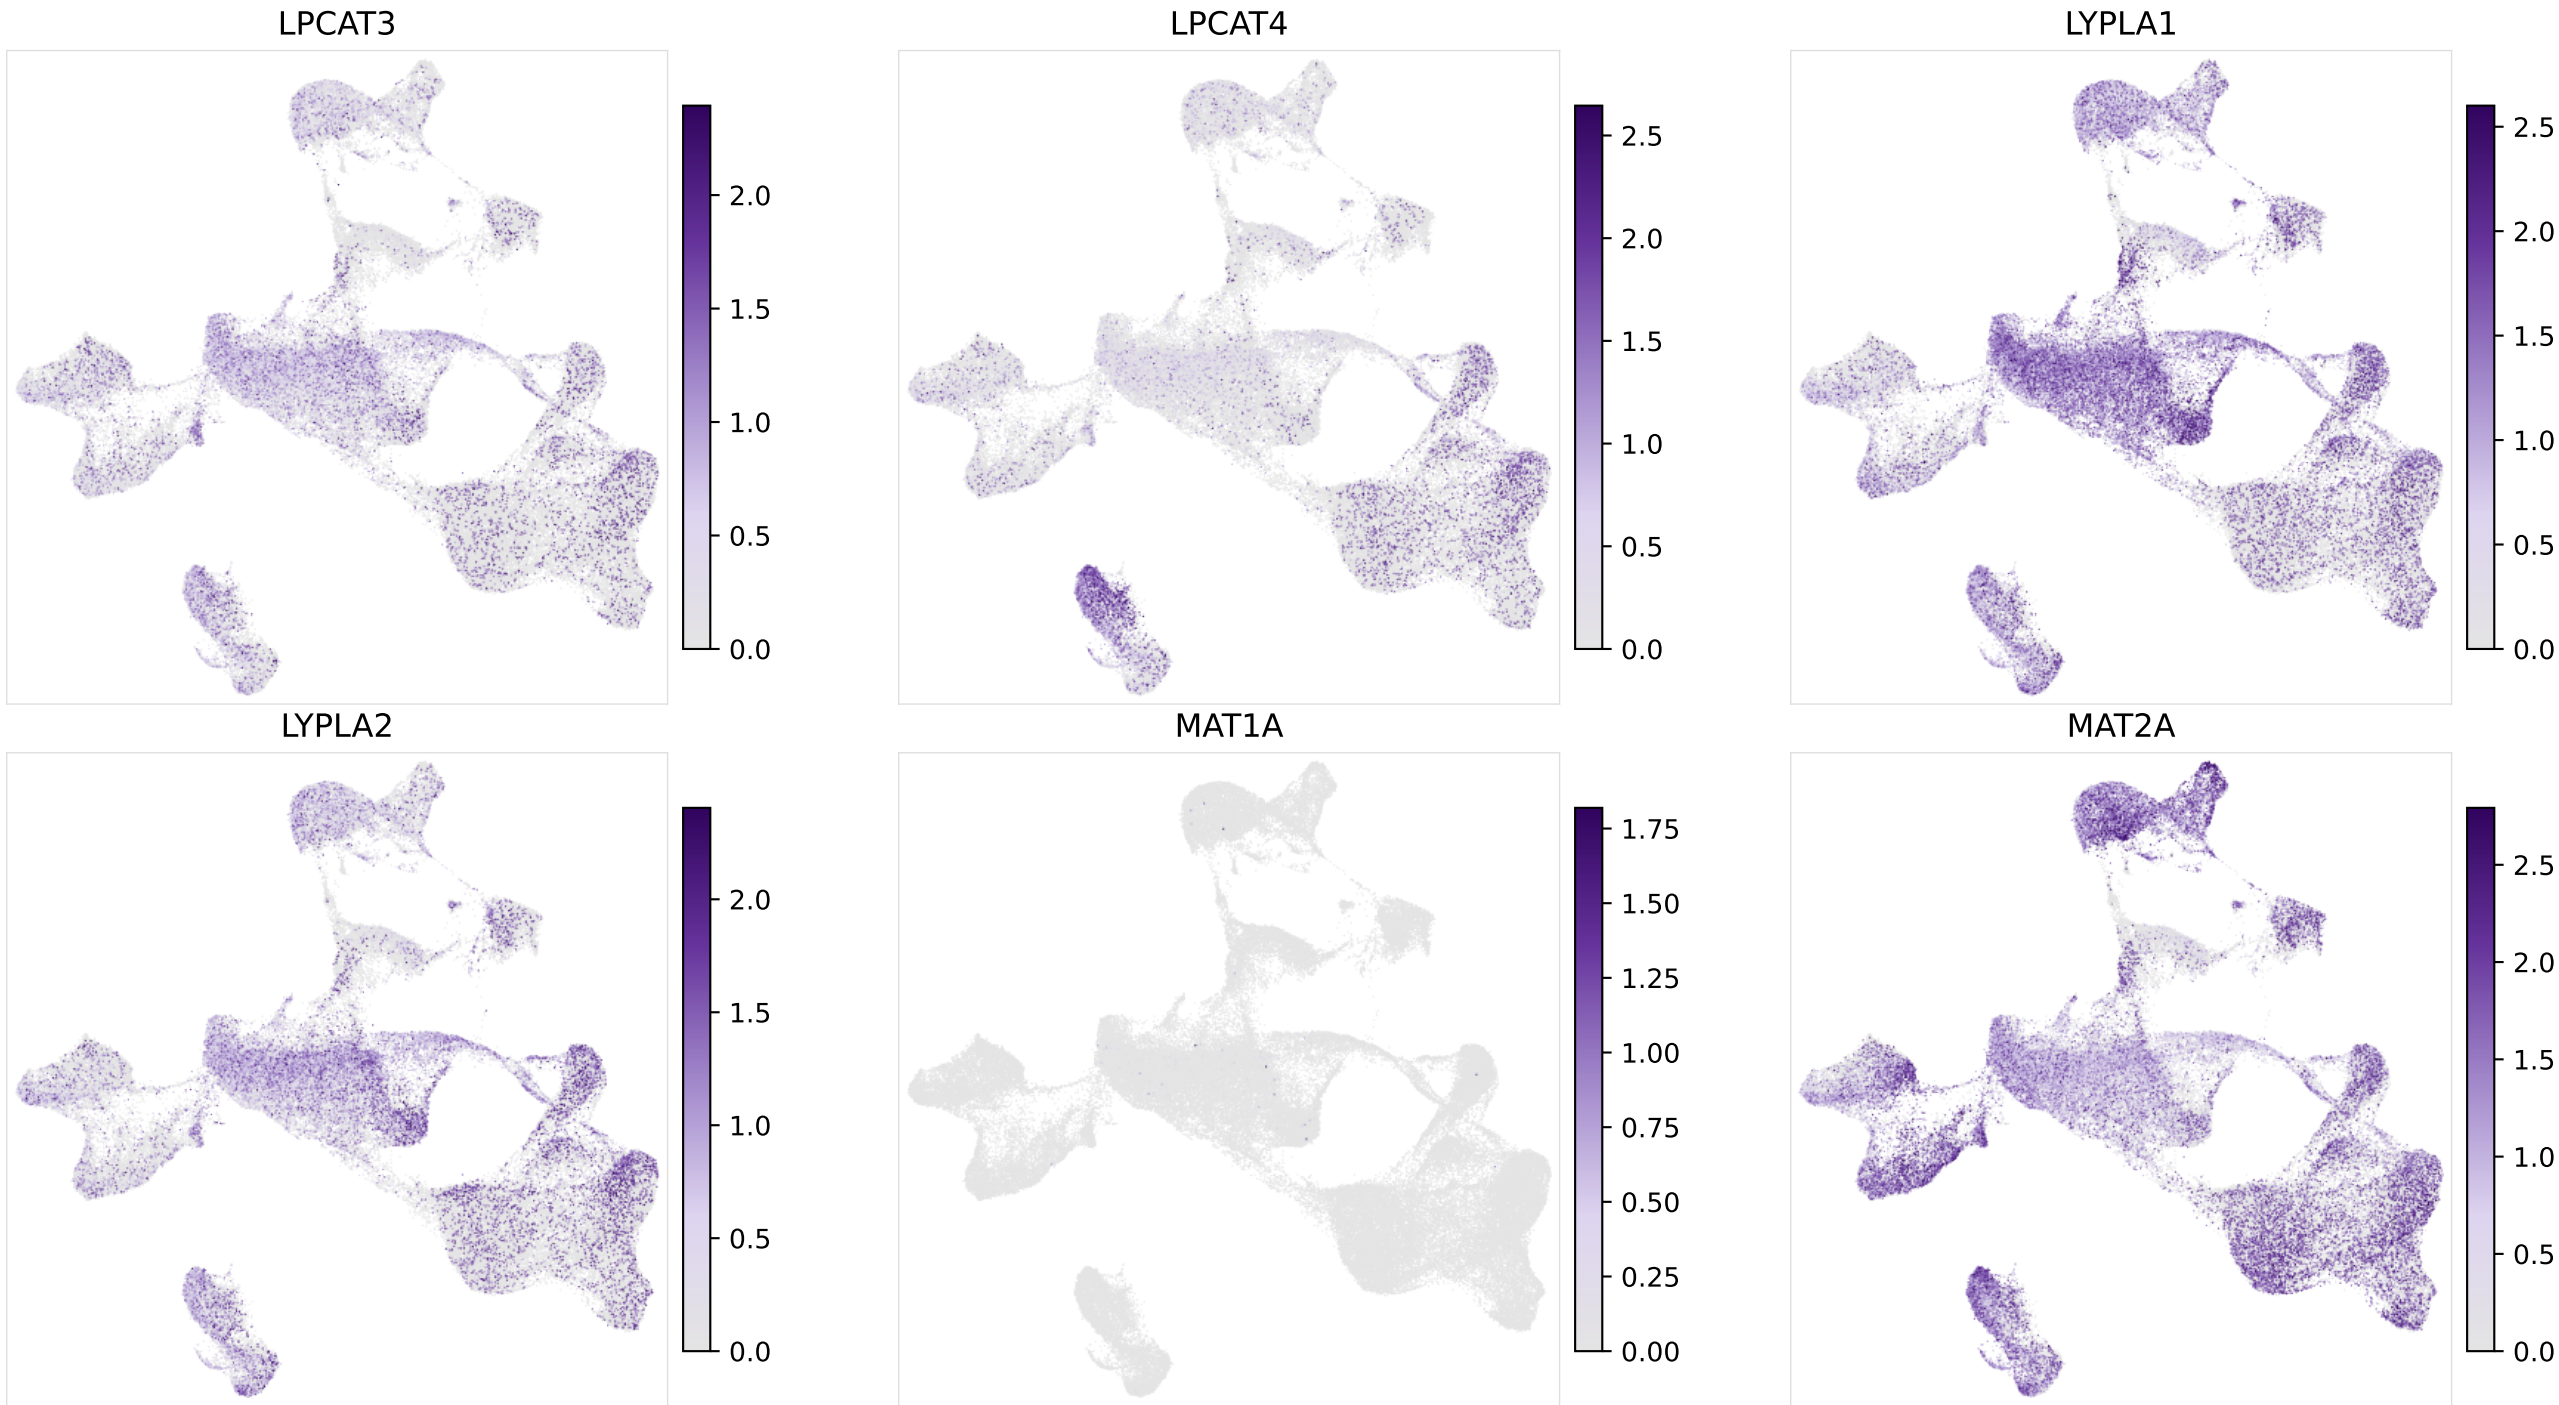

Existing embedding; all cells; high values plotted last. Gray = zero/low; each gene has own color cap.
No new clustering or statistical tests. log1p(counts per10k), clipped at positive-value 99th percentile.

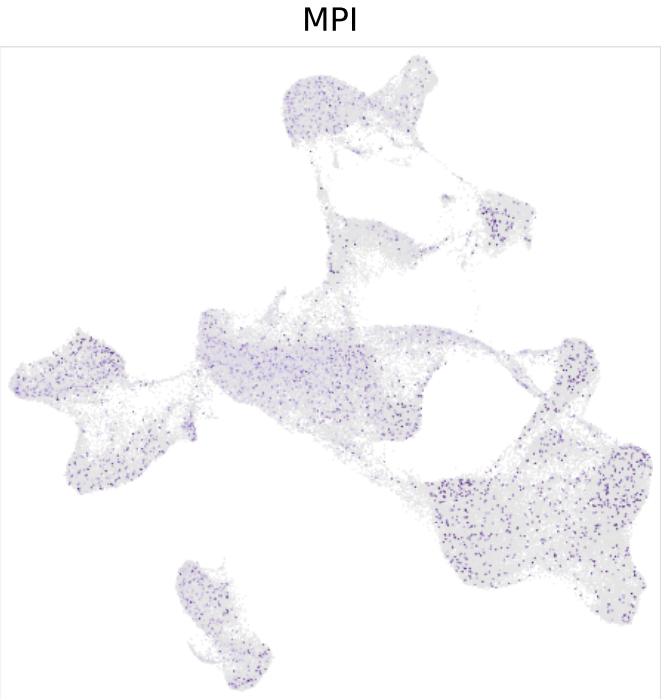

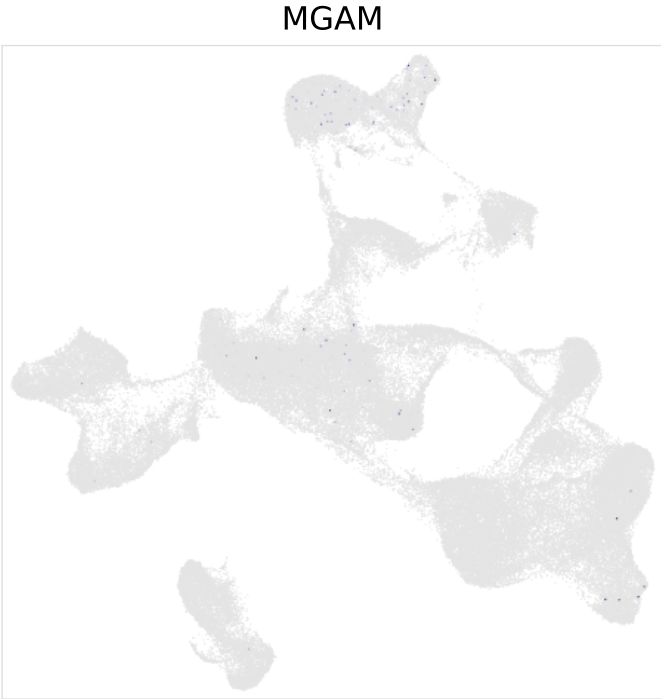

Existing embedding; all cells; high values plotted last. Gray = zero/low; each gene has own color cap.
No new clustering or statistical tests. log1p(counts per10k), clipped at positive-value 99th percentile.

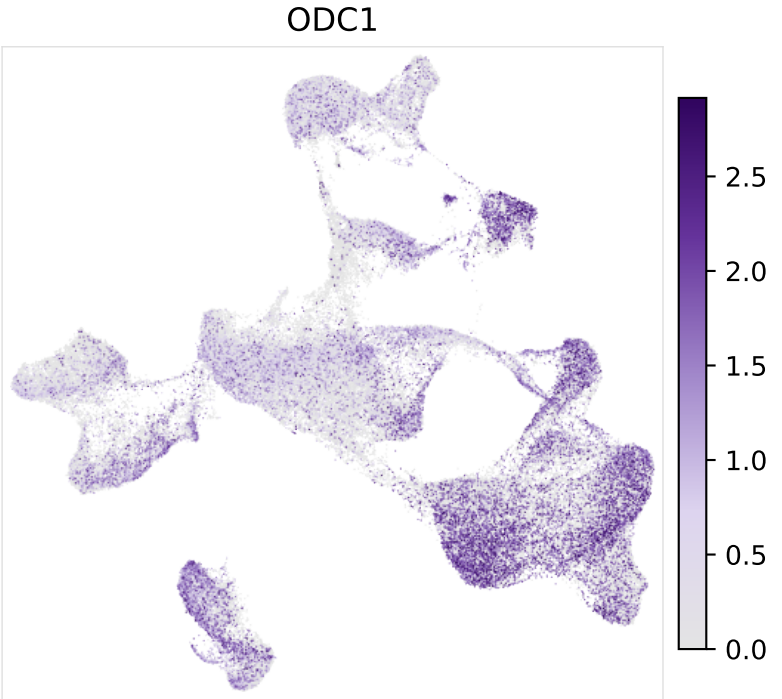

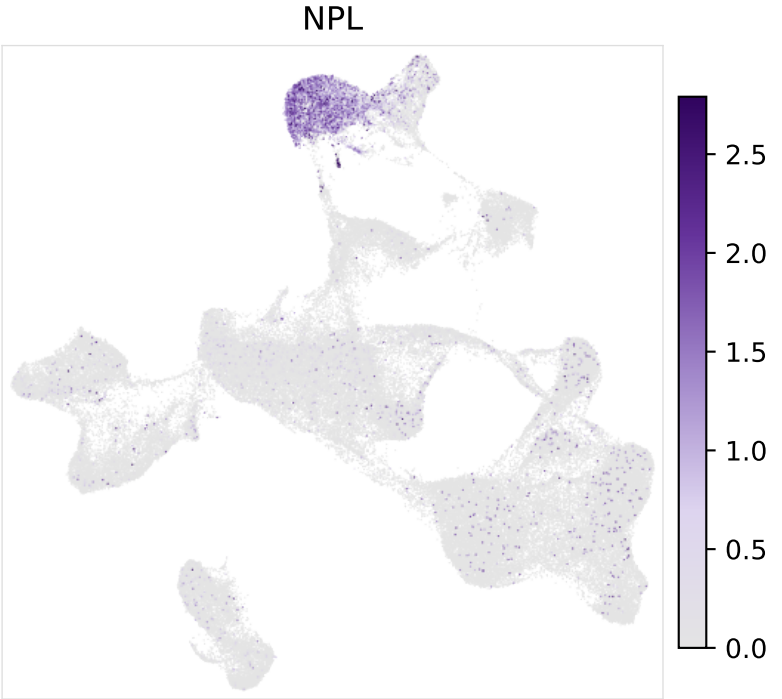

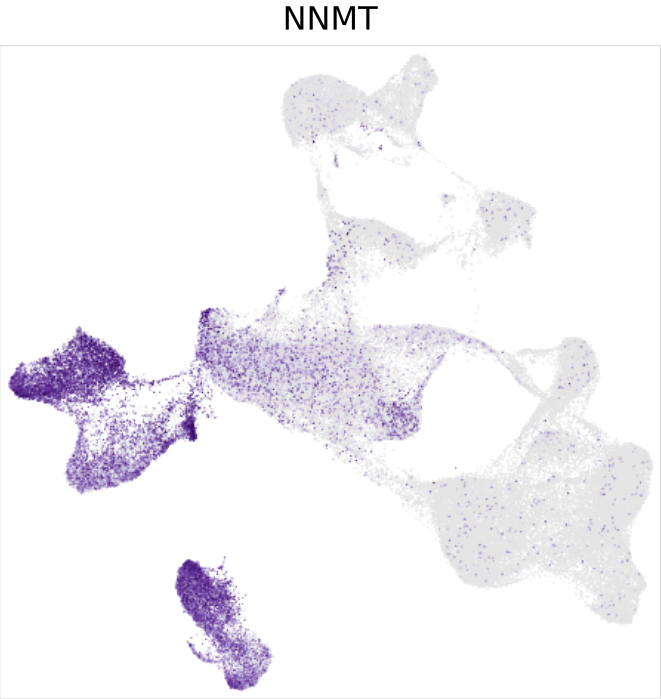

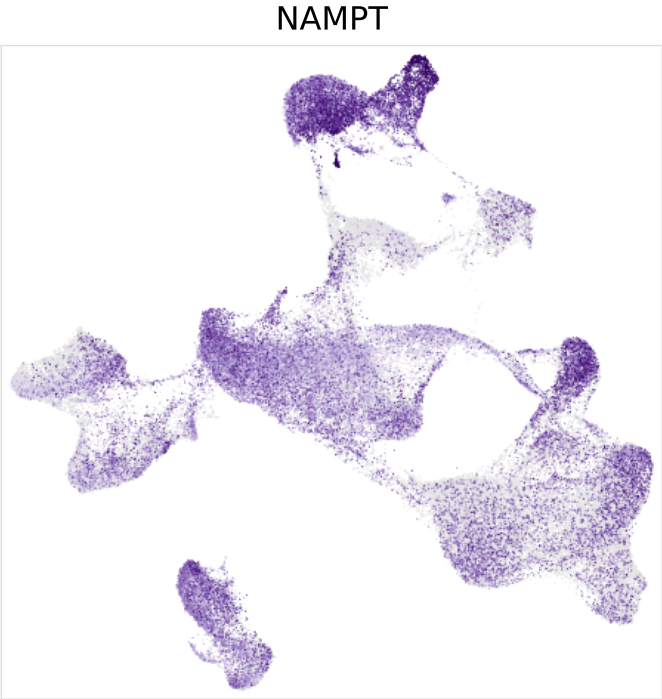

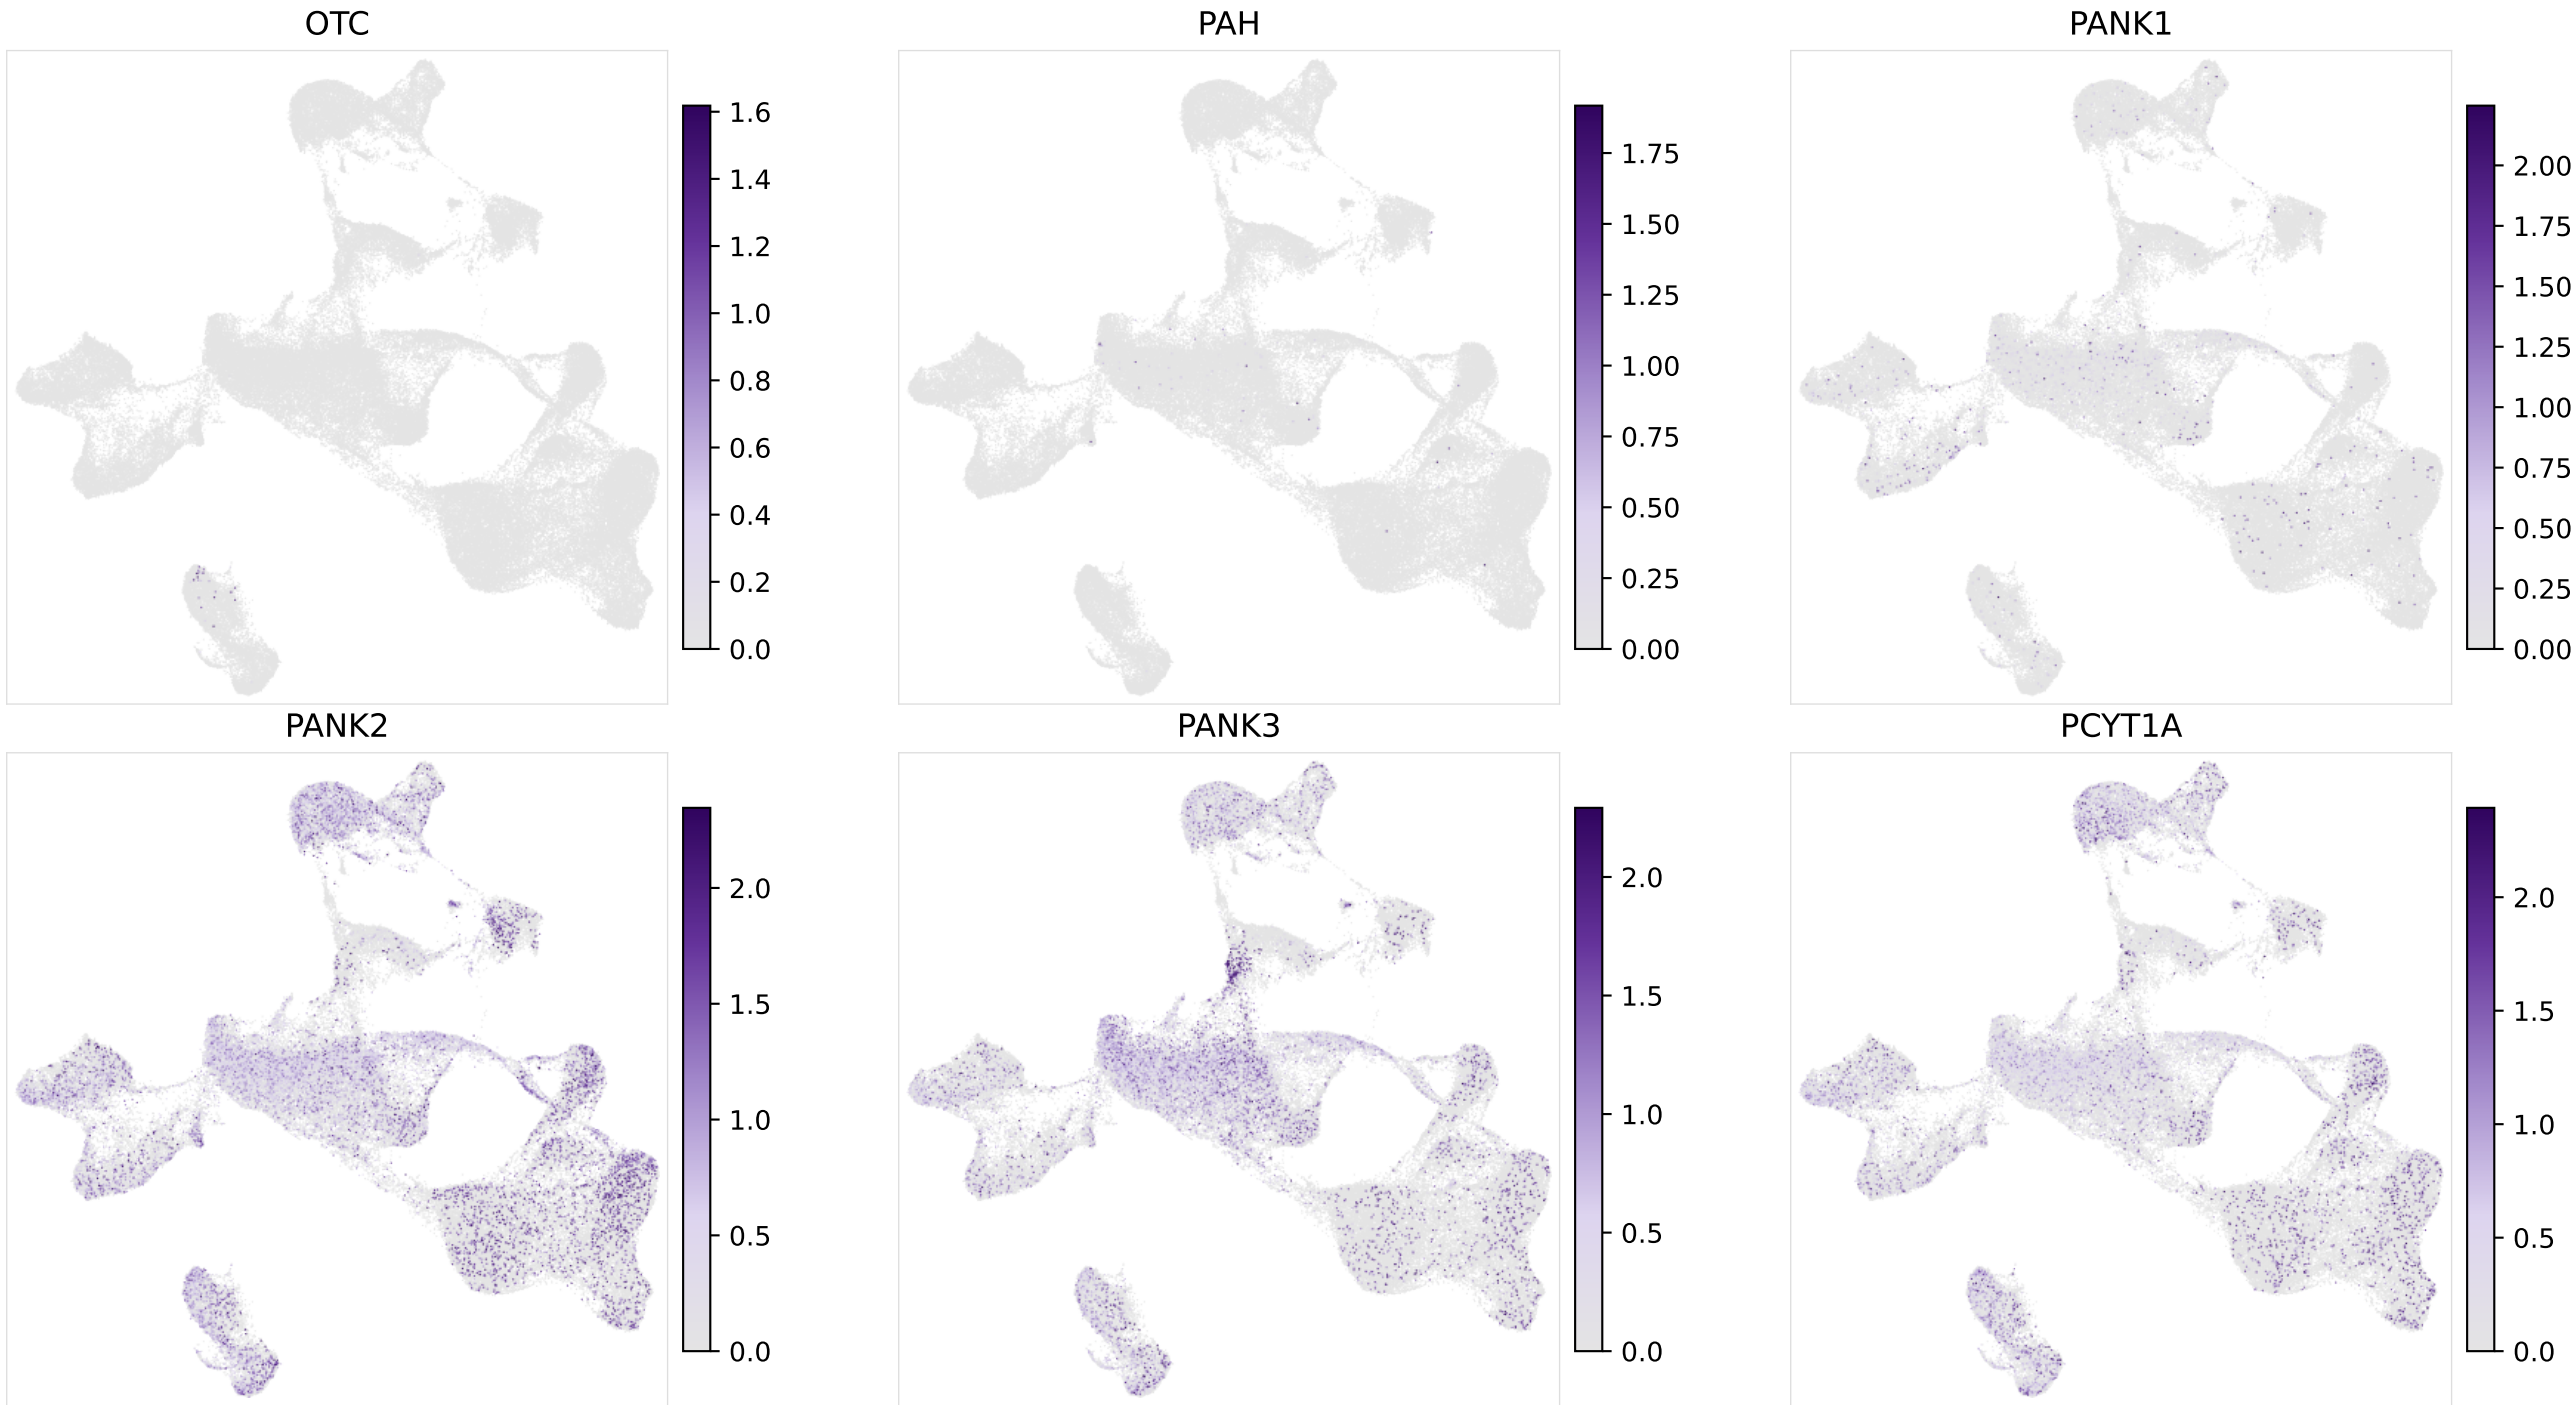

Existing embedding; all cells; high values plotted last. Gray = zero/low; each gene has own color cap.
